

### **Claim Amendments:**

1. Cancelled

2. (Currently Amended) ~~The conveyORIZED plating line according to claim 1, Δ~~  
conveyorized plating line for electrolytically metal plating workpieces, wherein means  
(17,18,21) are provided to reduce an electric voltage that builds up between adjacent  
workpieces (5,6,7) being conveyed through the line, wherein the means are at least one  
guard electrode (17,18) that is provided for in the line, in an entrance region for the  
workpieces (5,6,7).

3. (Original) The conveyORIZED plating line according to claim 2, wherein the at least  
one guard electrode (17,18) substantially delimits the entrance region from a processing  
region for the workpieces (5,6,7) in which anodes (11) are disposed.

4. (Original) The conveyORIZED plating line according to one of the claims 2 and 3,  
wherein the at least one guard electrode (17,18) is disposed in such a manner that it  
does not touch the workpieces (5,6,7) as they are being passed through the line.

5. (Previously amended) The conveyORIZED plating line according to one of the claims  
2- 3, wherein the at least one guard electrode (17,18) is cathodically polarizable relative  
to the anodes (11).

6. (Previously Amended) The conveyORIZED plating line according to one of the claims  
2-3, wherein the at least one guard electrode (17,18) is connected to a current source for  
electrolytic metal plating through at least one limiting resistor (19,20).

7. (Original) The conveyORIZED plating line according to claim 6, wherein the at least  
one limiting resistor (19,20) is adjustable.

8. (Previously Amended) The conveyORIZED plating line according to one of the claims  
2-3, wherein the number, the shape, the spatial arrangement and/or the size of the at

least one guard electrode (17,18) are determined in view of the reduction of the electric voltage between adjacent workpieces (5,6,7) in the line.

9. (Currently Amended) The conveyORIZED plating line according to one of claims 1-3, wherein at least one current source providing an electric current flow to the workpieces (5,6,7) is provided, wherein electrical contacting members (9,16) for the workpieces (5,6,7) are provided and wherein at least one electric compensating resistor (21) is provided for in a current path leading from the current source to the contacting members (9,16).

10. (Original) The conveyORIZED plating line according to claim 9, wherein the at least one current source is electrically connected to the electrical contacting members (9,16) for the workpieces (5,6,7) through current lines and a contact rail or brushes, at least one electric compensating resistor being mounted in series in proximity to the entrance region of the line and the contacting members being connected to either end of the at least one compensating resistor.

11. (Previously Amended) The conveyORIZED plating line according to claim 9, wherein the at least one compensating resistor (21) is adjustable.

12. (Previously Amended) The conveyORIZED plating line according to claim 9, wherein, if at least two contacting members (9,16) are provided, the compensating resistors (21) are adjustable in such a manner that the voltage drop is greatest in that compensating resistor (21) which is assigned to the first contacting member (9) as viewed in the direction of transport.

13. (Currently Amended) The conveyORIZED plating line according to one of claims 1-3, wherein, for contacting the workpieces (5,6,7) with the electrolyte fluid as they are being passed through the line, a space in which the electrolyte fluid accumulates is provided which the workpieces (5,6,7) can enter and which the workpieces (5,6,7) can exit again once they have been conveyed through the line.
